From Voice of America

IAGS' Dr. Gal Luft was interviewed in a report on the the relationship between energy security and oil costs.

"As cyber terrorists realize the vulnerability, they may improve their technical sophistication and eventually develop capabilities that could wreak havoc in global oil and gas markets," said Luft.

So far, the most serious cyber attacks have been aimed at power grids rather than at oil or gas production. Luft said, however, that could change.

Meantime, oil prices that spiked right after the Algeria attack remain high.
